Core Canadian Longitudinal Study on Aging (CLSA) Data Collection (pre-COVID-19)

Following 50,000+ participants in Canada aged 45-85 at baseline for 20 years

CLSA COVID-19 Questionnaire Study

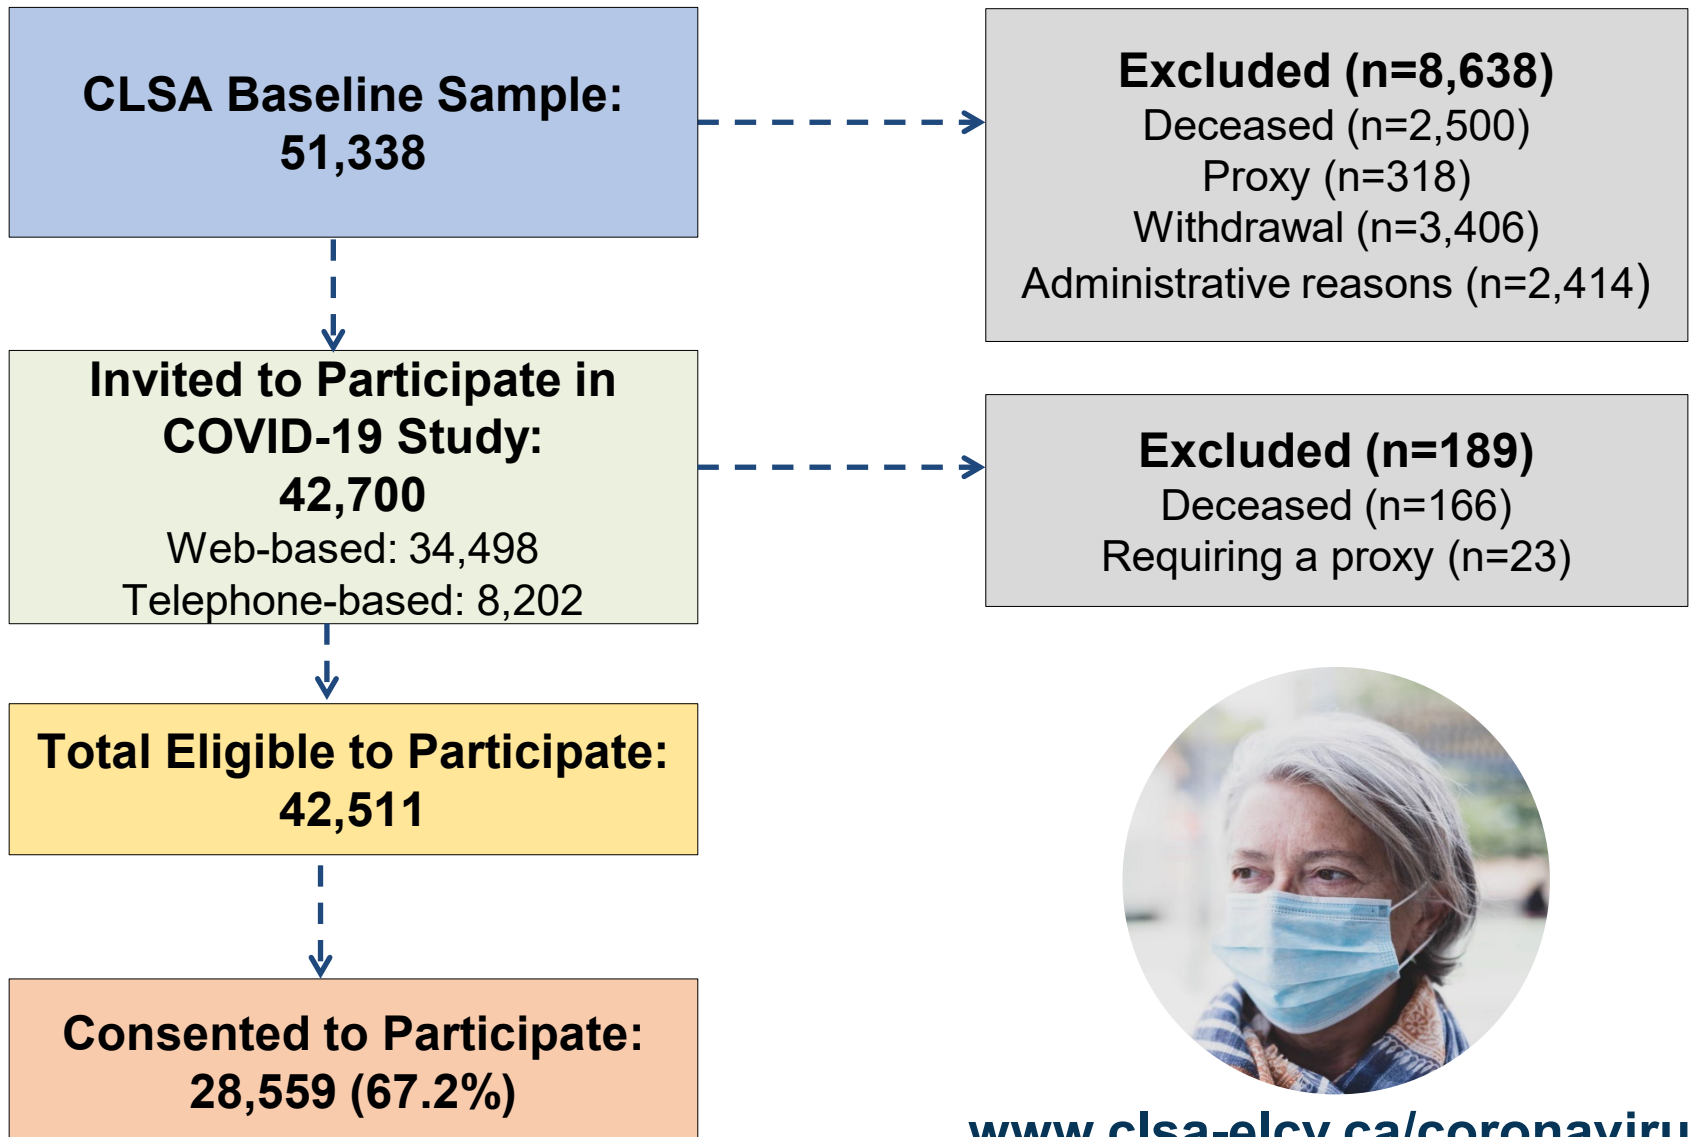

- Launched in April 2020 to address concerns about the impact of the COVID-19 pandemic
- Weekly, biweekly, monthly data collection conducted until the end of 2020

CLSA COVID-19 Questionnaire Study Aims

- COVID-19 Symptoms, Testing, Outcomes
- Risk factors
- Health-care use/access
- Health behaviours
- Public Health measures
- Social factors
- Depression and anxiety
- Economic consequences
- Function and mobility

COVID-19 Exit Survey Participant Demographics

Total sample size: 23,822

Age (years)	N (%)
<55	879 (3.69)
55-64	7049 (29.59)
65-74	8766 (36.80)
≥75	7128 (29.92)

Sex at birth	N (%)
Female	12635 (53.04)

Race	N (%)
White	22177 (93.84)
All other categories	1456 (6.16)

Education	N (%)
Less than secondary school graduation	1082 (4.55)
Secondary school graduation	2331 (9.80)
Some post-secondary education	1704 (7.17)
Post-secondary degree	18662 (78.48)

Income	N (%)
< \$20,000	832 (3.72)
\$20,000 to < \$50,000	4779 (21.36)
\$50,000 to < \$100,000	8477 (37.89)
\$100,000 to < \$150,000	4555 (20.36)
\$150,000 or more	3731 (16.68)

Urban/Rural	N (%)
Urban	19470 (82.16)

Willingness to receive COVID-19 Vaccine

"If a safe and effective COVID-19 vaccine were available to you, how likely would you be to choose to get the vaccine?"

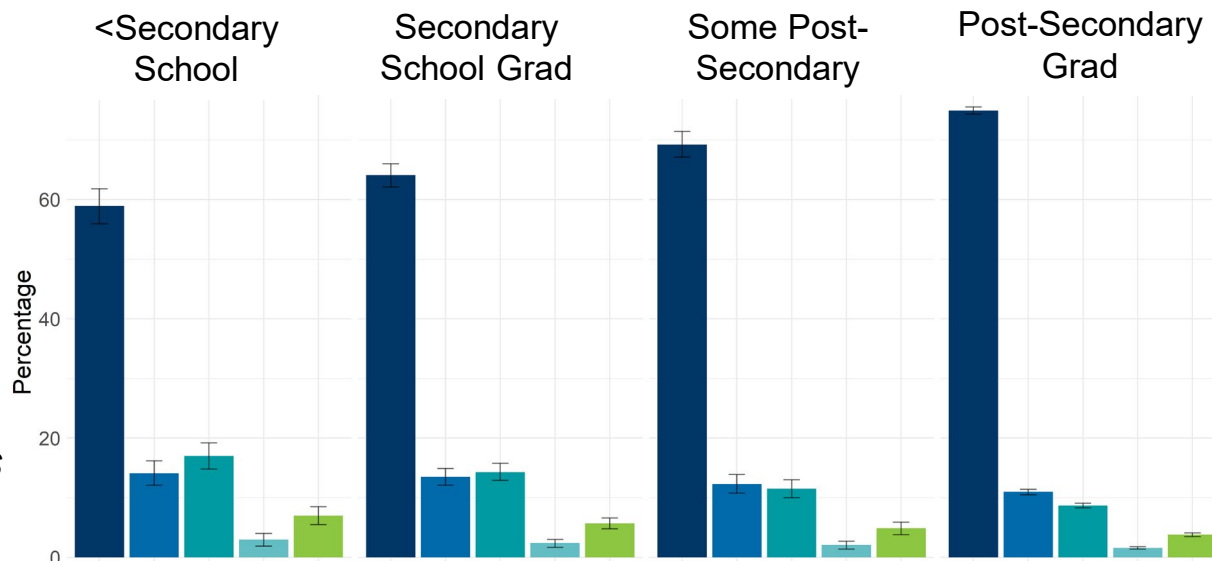

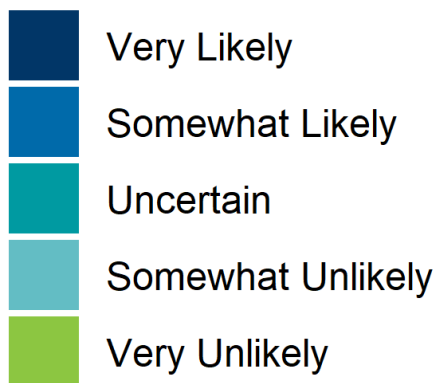

Distribution by Age Group and Sex At Birth

COVID-19 vaccine willingness

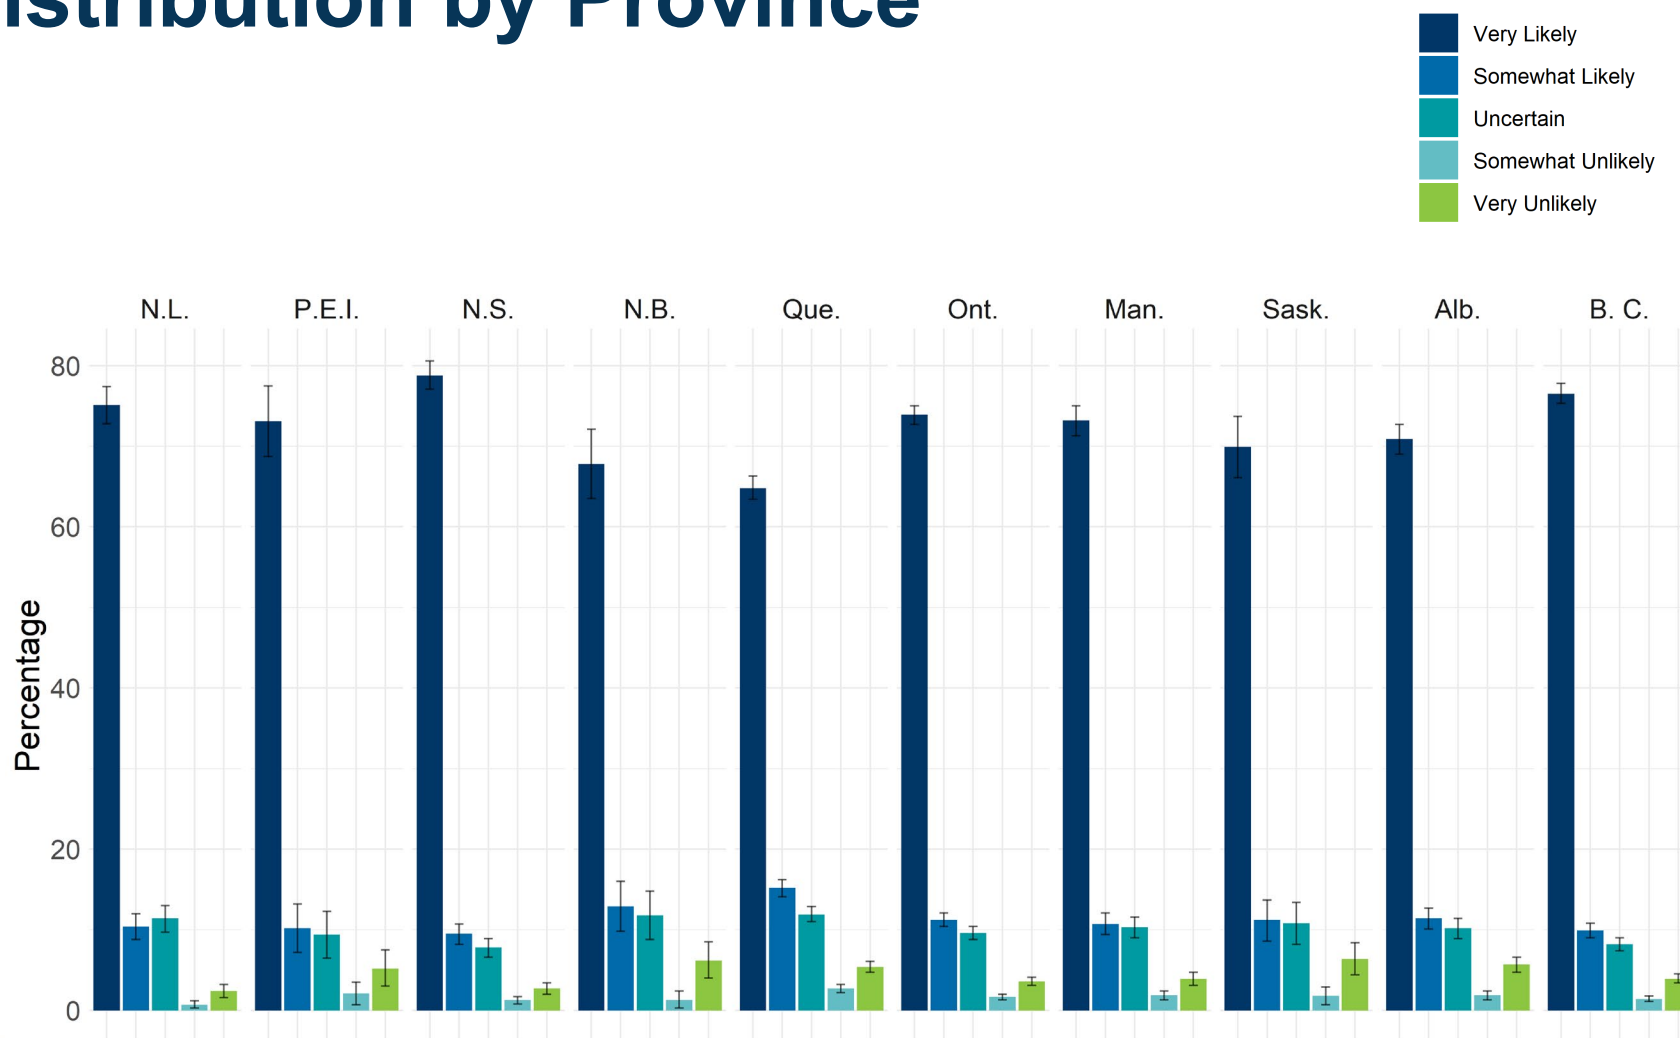

Distribution by Education and Income

COVID-19 vaccine willingness

Distribution by Province

COVID-19 vaccine willingness

Association between sociodemographic factors and likelihood of choosing to receive a COVID-19 vaccine

ORs and 95% CIs are drawn from a logistic regression model

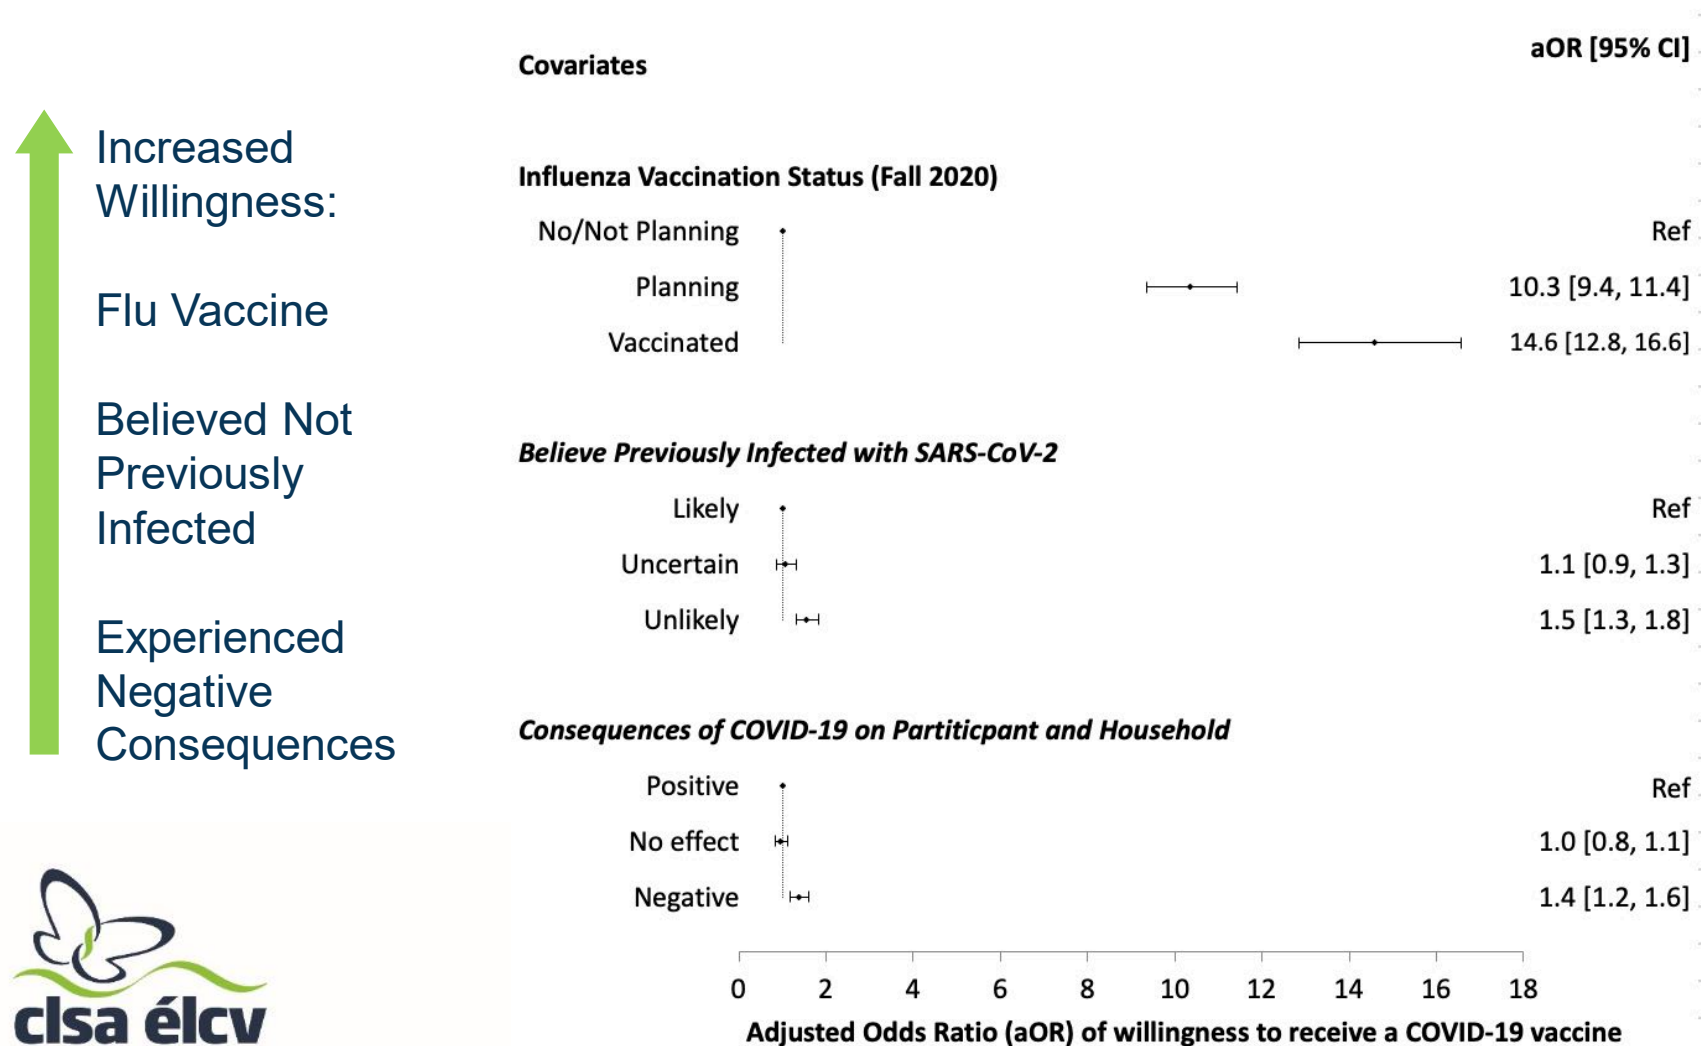

Increased
Willingness:

Ages: 65+
Sex: Males
Edu: Higher
Income: Higher
Race: White
Residence: Urban

Are other factors associated with COVID-19 vaccine willingness?

ORs and 95% CIs are drawn from a logistic regression model controlled for all demographic factors

Primary Reasons for Vaccine Willingness: Protecting Self, Protecting Family and Contributing to Ending Outbreaks

$n=19,963$ (84.1%)

Majority of Those Unwilling to Receive COVID-19 Vaccine Primarily Concerned about Vaccine Safety

$n=3,684$ (15.9%)

Strengths

- Largest survey among Canadian adults to date
- Drawn from an established national cohort

Limitations

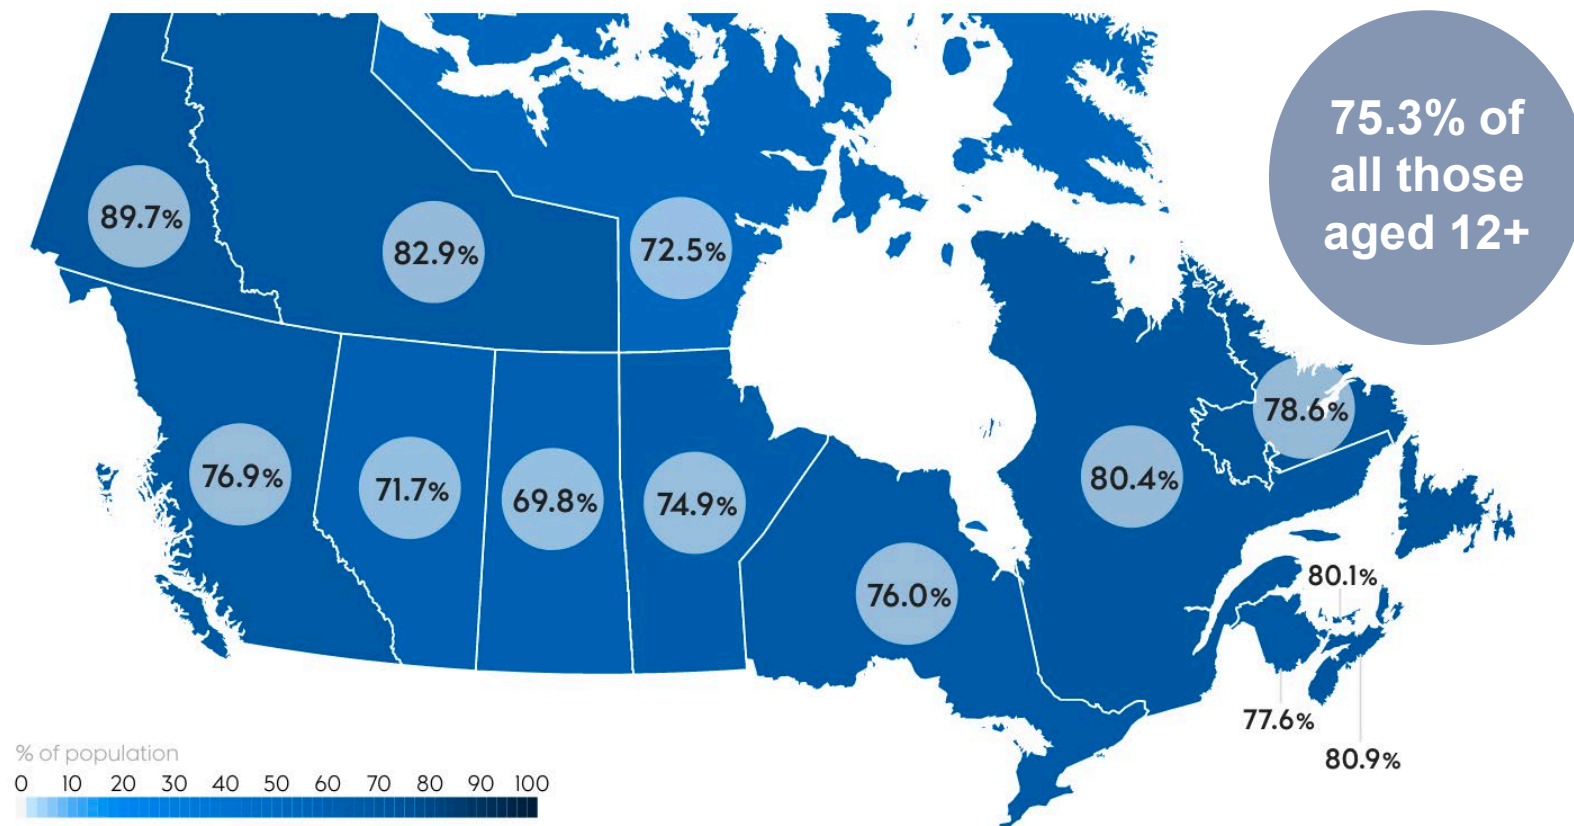

- Based on self-reported willingness only
- No data on uptake

Overview

- CLSA-COVID-19 Questionnaire Study
- Analysis of COVID-19 Survey Data on Vaccine Willingness
- **Current COVID-19 Vaccine Uptake**

Current Progress on COVID-19 Vaccine Uptake

Percentage of eligible population (12+) vaccinated with at least one dose

COVID-19 Vaccine Uptake by Age Group

Percentage of eligible population vaccinated with at least one dose (June 19, 2021)

50 to 59: 79.03%
60 to 69: 87.77%
70 to 79: 93.32%
80+: 94.09%

CLSA COVID-19

Exit Survey

Very or Somewhat Likely (+Uncertain)

50 to 59: 73.79% (84.38%)

60 to 69: 84.38% (93.79%)

70 to 79: 86.57% (95.59%)

80+: 83.09% (94.68%)

Engaging in Effective Communication about COVID-19 Vaccines

1. Approach Empathetically and Establish Trust

2. Encourage Questions

3. Listen and Understand Reasons for Concern

4. Share Personal Stories & Seek out Evidence from Trusted Sources

5. Provide a Strong Recommendation to Get Vaccinated, Motivated by Concern and Caring

6. Offer Support to Overcome Barriers, Perhaps Help Schedule an Appointment or Arrange Transportation

Summary

- The CLSA COVID-19 Questionnaire Study presented an excellent opportunity to investigate COVID-19 vaccine willingness in a large, robust sample of >23,000 adults across Canada
- COVID-19 vaccine willingness among adults aged 50+ was high even prior to vaccine introduction: 84.1%
- Females, 50-64 year olds, those who self-identified with a race other than white, those with lower educational attainment and lower reported income, and living in rural areas less likely to get COVID-19 vaccine, however...
- Not receiving flu vaccine, having had COVID-19 previously, and not having experience negative impacts were all associated with decreased willingness even after controlling for demographics
- Opportunities exist to address primary concerns including safety concerns. These results can help inform targeted outreach programs to improve COVID-19 vaccine uptake.
