Population Studies in Health**
University of Lethbridge

Territorial acknowledgment

Oki, and welcome to the University of Lethbridge. Our University's Blackfoot name is Iniskim, meaning Sacred Buffalo Stone.

The University is located in traditional Blackfoot Confederacy territory. We honour the Blackfoot people and their traditional ways of knowing in caring for this land, as well as all Indigenous Peoples who have helped shape and continue to strengthen our University community.

Sociodemographic determinants of mobility decline among community-dwelling older adults: findings from the Canadian longitudinal study on ageing

Ogochukwu Kelechi Onyeso^{1*}, Chiedozie James Alumona¹, Adesola Christiana Odole², Janice Oluwalanmikanmi A. Awosoga¹

Introduction

Introduction

- The population of older adults 65 years and older is increasing (Bloom et al., 2015).
- Estimate for 60 years and older: 800 million (12%) in 2015 to about (22%) 2.1 billion by 2050 (WHO, 2025).
- **Canadian estimate: 19% in 2023 to 25% in 2050.**
- Age-related mobility limitation will also increase (Metz, 2000).

Mobility

Active

Walk (Ambulation)

- Unassisted
- Assisted

Motorized

Transport

- Mobility is a person's ability to move around safely and independently, without or with a walking aid (Webber et al., 2010).

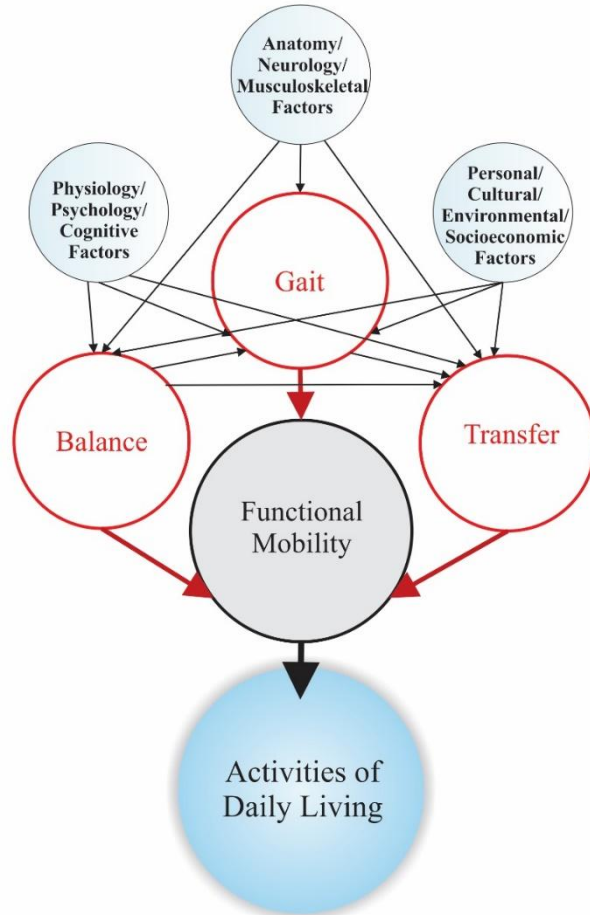

“Mobility is not just the ability to move but the essence of autonomy, dignity, and participation. When mobility is limited, the journey of life itself becomes constrained, demanding resilience and adaptation in the face of ageing.”

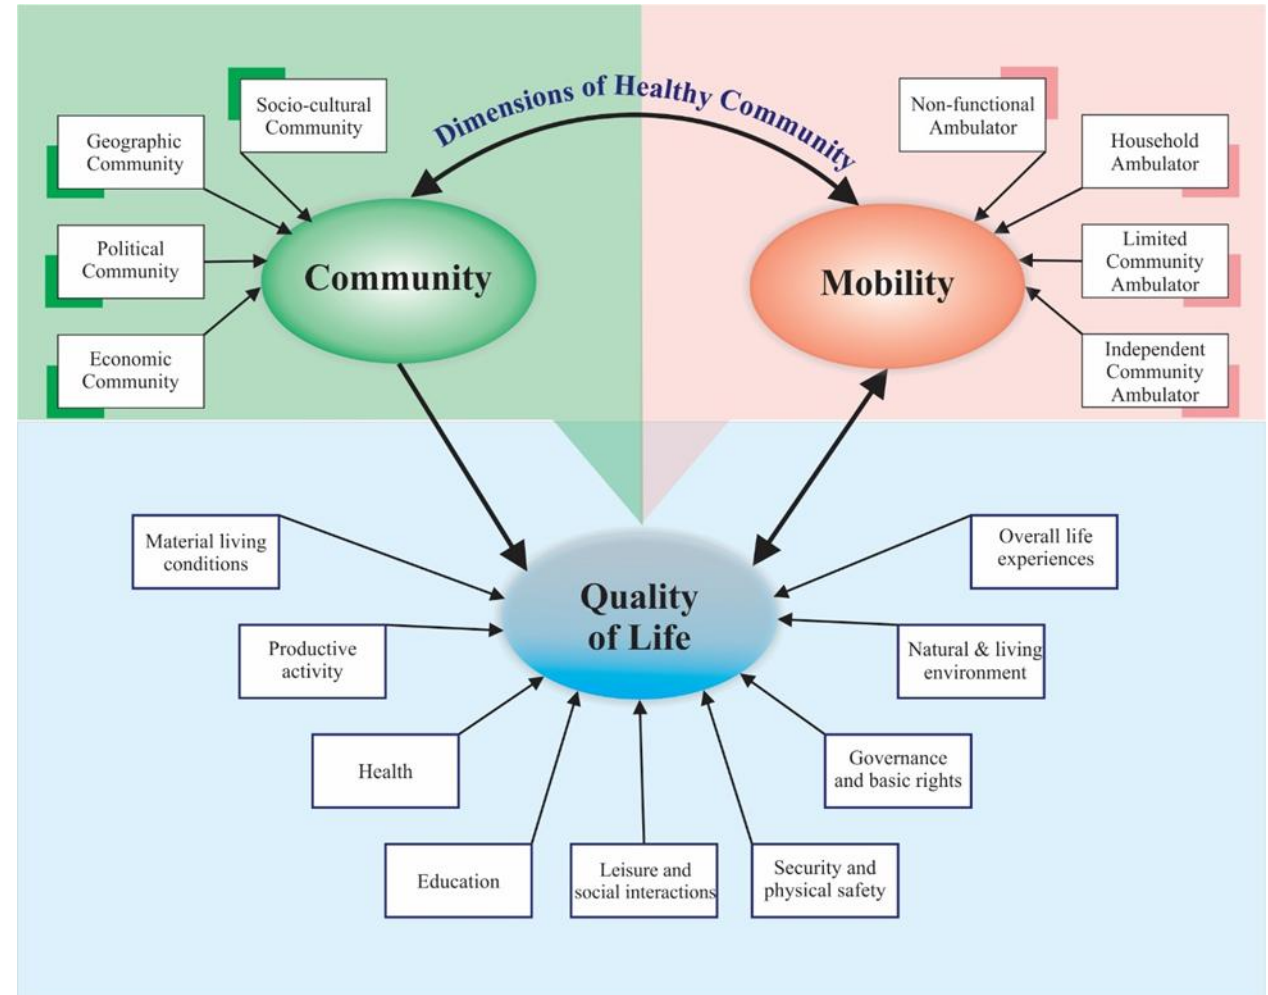

Background

- Studying mobility limitation in older adults is important.
- Mobility impairment leads to:
 - physical disability and institutionalization
 - frequent falls and injuries
 - sedentary behaviour and dependency
 - depression and social isolation
 - reduced quality of life and death
- ~20.6% Canadians aged ≥ 65 years reported mobility limitations as of 2012; the trend increases with age (Bizier et al., 2016).

Background

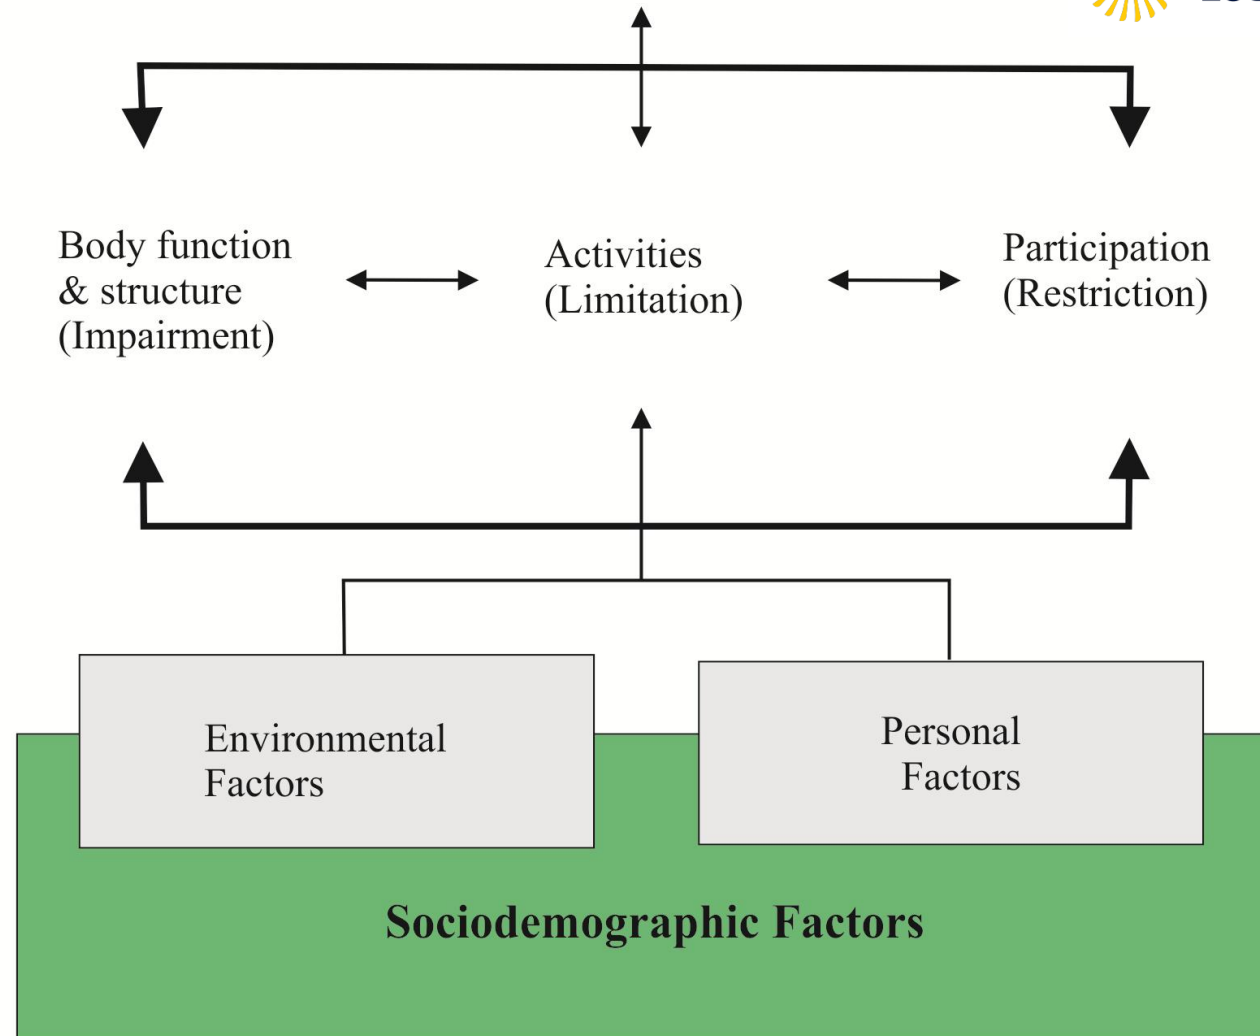

balance, and transfer as components of functional mobility.

Community, mobility, and quality of life interactions.

Mobility Limitation

Conceptual
Framework

International Classification of Functioning, Disability and Health (ICF) model.

Theoretical Framework

Life course and social determinants of health theories (Marengoni & Calderon-Larrañaga, 2020)

Empirical Literature Review

Age

Insights from Systematic Review

PRISMA Flowchart

Insights from Systematic Review

Narrative synthesis in chart

Summary of gaps in Literature

- Determinants of mobility in older adults.
 - Biophysical and psychocognitive.
 - **Sociodemographic.**
- Descriptive and without inferential analysis of SDF.
- Few longitudinal studies.
- Scarcity of disaggregated analysis.
- Paucity of a systematic review.

Objectives

Study objectives were to:

Assess Mobility Changes

- Examine mobility changes over six years to track decline.

Explore Sociodemographic Factors

- Study investigates how age, gender, economic and social factors affect mobility decline.

Validate Mobility Tests

- 4MWT vs. TUG tests.

Identify Influencing Factors

- Classify factors as modifiable and non-modifiable.

Sociodemographic determinants of mobility decline among community-dwelling older adults: findings from the Canadian longitudinal study on ageing

Ogochukwu Kelechi Onyeso^{1*}, Chiedozie James Alumona¹, Adesola Christiana Odole², Janice V

Methods

Data Source & Study Design

- Secondary analysis of CLSA's comprehensive cohort: Baseline, FU1, FU2
- CLSA: National bilingual longitudinal study (2011–ongoing), 30,097 participants aged 45–85
- Data collected in-person: sociodemographics, biospecimens, physical measures (TUG, 4MWT)
- Follow-up every 3 years for ≥ 20 years
- Sample: 3,882 participants aged ≥ 65 at baseline, completed all 3 cycles, never lived in long-term care
- Ethics: Approved by 13 university boards and the University of Alberta (Pro00129371)

Mobility Outcomes

- Primary measures: Time to complete TUG and 4MWT
- TUG: Assesses gait, balance, transfer; high reliability ($r = 0.99$), strong validity ($r = 0.75$)
- 4MWT: Measures gait speed; reliability ($r = 0.96$ – 0.98), validity ($r = 0.93$)
- Tools: Stopwatch and meter rule used for measurement

Explanatory Variables & Covariates

- Sociodemographic variables:
 - Age, sex, marital status, country of birth, ethnicity, cultural identity
 - Province, residence area, education, occupation, income, wealth
 - Homeownership, home type, religion, retirement status, social status
- Social status: MacArthur Scale (1–10 ladder)
- Covariates:
 - Smoking, alcohol use, chronic disease status, general health

Analytic Lenses

Directed Acyclic Graph (DAG)

Data Analysis

- Software: SPSS v28 and R Studio v4.4.1, weighted dataset
- Descriptive stats: Frequency, %, mean, SD, bar chart
- Assumption checks:
 - Outliers: Z-score $> \pm 3.29$, Mahalanobis distance
 - Normality: Q-Q plot
 - Sphericity: Mauchly's test
 - Homogeneity: Levene's test
 - Linearity & multicollinearity ($VIF < 4$)
- Transformations: Log-transformed TUG and 4MWT
- Inferential tests:
 - χ^2 (Hypothesis I), Repeated Measures ANOVA (II), Bivariate Regression (III), Multivariate Regression (IV), Pearson's r (V), Alpha level: 0.05

Results and Discussion

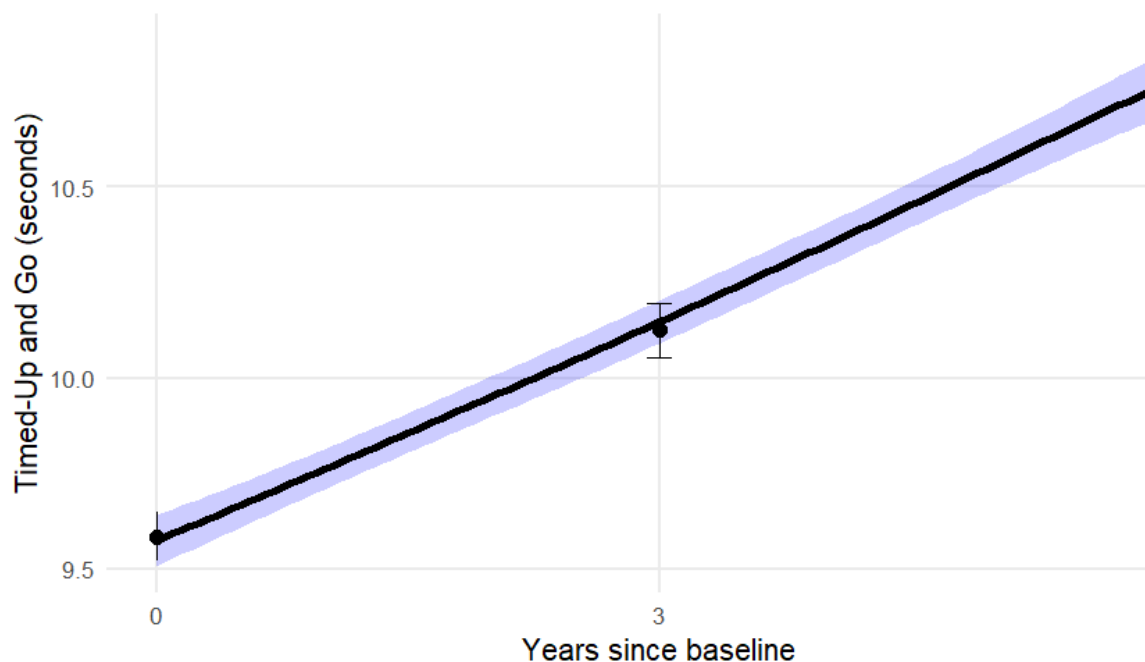

Results Summary

- At baseline, 52% were women, 70.4% were married (n=3882).
- Mean \pm SD: Age = 68.82 \pm 2.78 years, TUG = 9.59 \pm 1.98 s, and 4MWT = 4.29 \pm 0.95 s.
- Strong concurrent validity of TUG & 4MWT (r=0.65, 0.74, & 0.75).
- Prevalence of mobility limitation (HGS < 1.00 m/s) = 57.7%.
- 6-year mobility decline predicted by: older age, being a woman, retired, Canadian born, non-Caucasian, tenant, having no spouse/partner, household income, wealth/investment, lower social status, lower education, and Provinces.

Insight from the qualitative study

Insight from the qualitative study

“I think we are more exposed to the climate. When they’re out in the country [environment], the weather in this area, of course, the wind is the major factor, followed by heatwaves in the summertime and cold in the winter.” – CA1, Man, 80, Teacher.

“Well, if you don’t eat the proper food, it will affect your bones and your brain. So, we have the Canadian Food Guide...As you know, there's a lot of obesity, against in the years when people cooked their own food...Someone [Regulatory Agencies] needs to determine how much fat, or sugar could be in a product.” – CA4, Woman, 78, Nurse.

Participants asked

“Address the threats of food, housing, social and financial insecurity.”

“Communities and Governments to Improve Health Access
- especially for rural dwellers”

“make public spaces/buildings accessible:
considering people with various levels of mobility”

“involve older adults in **decision-making**”

Conclusions

Conclusion

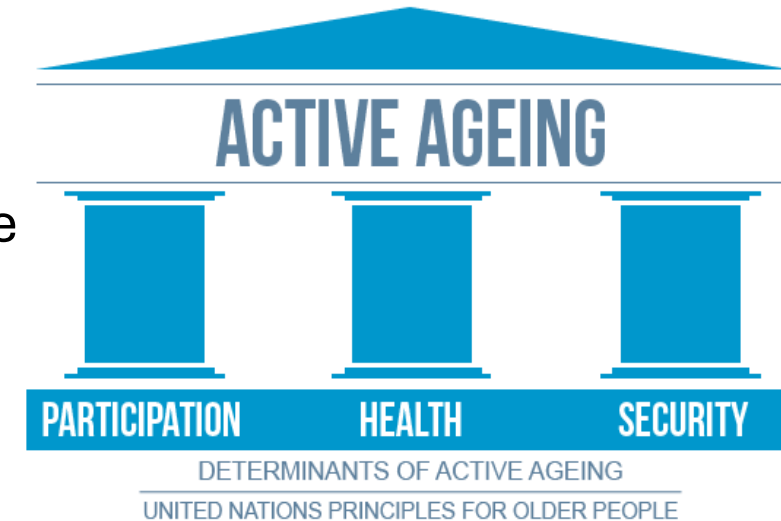

- Few studies on SDFs in mobility decline, outside the USA.
- CLSA baseline TUG = 9.70 ± 2.01 s; global estimate = 7.67 ± 3.56 s (95% CI: 7.61, 7.73), range 5.71 to 12.6.
- High prevalence of mobility limitation in CLSA.
- Older adults' perspectives align with the quantitative outcome.
- Modifiable SDFs influence older adults' mobility trajectory; social justice, equity, and fairness may ameliorate the factors.

Limitations

- CLSA's COM may have more urban participants (Provinces = 7 only).
- Non-randomized sampling, self-selection, favours the more educated.
 - Rural dwellers, new immigrants, people of lower economic status, and the BIPOC may be underrepresented.
- Missing values and attrition may affect the result, especially FU2.
- Secondary analysis is limited to variables available.

Policy implications

- Advocacy for culturally sensitive policies.
- Update National and Provincial ageing policies and incorporate relevant international treaties and declarations.
- Enact rights and privileges legislation as a political buffer.
- Ensure financial, social, physical, and food security.
- Expand health access/coverage (UN/WHO's Decade of Healthy Ageing).
- Invest in infrastructure (WHO's Age-friendly Communities).

Advances in Aging Research

Canadian provincial, territorial, and federal government aging policies: A systematic review

Donna Marie Wilson^{*}, Jane Osei-Waree, Jessica Anne Hewitt, Andrew Broad

Faculty of Nursing, University of Alberta, Edmonton, Canada; ^{*} Corresponding Author: donna.wilson@ualberta.ca

Received 3 July 2012; revised 5 August 2012; accepted 12 August 2012

ABSTRACT

In most countries, population aging is becoming more evident now that the first members of the large babyboom cohort have reached 65 years of age. As an accelerating increase in the num-

ber of persons who not only reach old age but also often reach advanced old age [3,4]. Although some futurists are suggesting that the babyboom cohort is more likely to be healthy and to work past age 65 as compared to previous cohorts [1,5], much concern exists in general about the impact of an aging population on the social and economic

Recommendations for future study

- Explore to uncover more SDFs.
- Use a longer follow-up period.
- Intersectionality analysis.
- Disaggregated analysis.
- Need for universal discussion on scale of measurement and the meaning of multidimensional SDFs, such as education and religion.
